

Research Compilation: Chaiphop Nilpat

1. Human-like Behavior Modeling for AI

This research explores the simulation of human-like actions for AI systems, especially in bot development for gaming or SaaS applications. It involves varying shooting speed, intentional misses, and pauses to mimic real user behavior and evade detection.

2. Blacklist Emotional Intelligence API

A secure MongoDB-based API for humanized blacklist systems. It includes emotional state analysis based on real names, age, gender, and visual profiles sourced from Google, enhancing safety and insight in system design.

3. High-performance SaaS Infrastructure

This study addresses how to build a scalable, multi-tenant SaaS system with real-time compute capacity (AI training, analytics), SLA support, and security-first architecture suitable for global tech operations.

4. DJ Branding with AI and Sound

This research explores AI-assisted branding and identity building for digital entertainers like DJs. It integrates emotional R&B/Pop/Rap music generation and sound design as core elements of online presence.
